**THE NEW JERSEY TURFGRASS ASSOCIATION**

In Cooperation With  
**RUTGERS COOPERATIVE EXTENSION**  
**NEW JERSEY AGRICULTURAL EXPERIMENT STATION**  
**RUTGERS, THE STATE UNIVERSITY OF NEW JERSEY**  
**NEW BRUNSWICK**

Distributed in cooperation with U. S. Department of Agriculture in furtherance of the Acts of Congress on May 8 and June 30, 1914. Rutgers Cooperative Extension works in agriculture, family and consumer sciences, and 4-H. Adesoji O. Adelaja, Director of Extension, Rutgers Cooperative Extension provides information and educational services to all people without regard to race, color, national origin, gender, religion, age, disability, political beliefs, sexual orientation, or marital or family status. (Not all prohibited bases apply to all programs.) Rutgers Cooperative Extension is an Equal Opportunity Program Provider and Employer.

# **2002 RUTGERS TURFGRASS PROCEEDINGS**

**of the**

**New Jersey Turfgrass Expo  
December 10-12, 2002  
Trump Taj Mahal  
Atlantic City, New Jersey**

The Rutgers Turfgrass Proceedings is published yearly by the Rutgers Center for Turfgrass Science, Rutgers Cooperative Extension, and the New Jersey Agricultural Experiment Station, Cook College, Rutgers, The State University of New Jersey in cooperation with the New Jersey Turfgrass Association. The purpose of this document is to provide a forum for the dissemination of information and the exchange of ideas and knowledge. The proceedings provide turfgrass managers, research scientists, extension specialists, and industry personnel with opportunities to communicate with co-workers. Through this forum, these professionals also reach a more general audience, which includes the public.

This publication includes lecture notes of papers presented at the 2002 New Jersey Turfgrass Expo. Publication of these lectures provides a readily available source of information covering a wide range of topics and includes technical and popular presentations of importance to the turfgrass industry.

This proceedings also includes research papers that contain original research findings and reviews of selected subjects in turfgrass science. These papers are presented primarily to facilitate the timely dissemination of original turfgrass research for use by the turfgrass industry.

Special thanks are given to those who have submitted papers for this proceedings, to the New Jersey Turfgrass Association for financial assistance, and to those individuals who have provided support to the Rutgers Turfgrass Research Program at Cook College, Rutgers, The State University of New Jersey.

# PERFORMANCE OF PERENNIAL RYEGRASS CULTIVARS AND SELECTIONS IN NEW JERSEY TURF TRIALS

Melissa M. Mohr, William A. Meyer, C. Reed Funk, William K. Dickson, Stacy A. Bonos,  
Eric Watkins, Ronald F. Bara, and Dirk A. Smith<sup>1</sup>

Perennial ryegrass (*Lolium perenne L.*) is a vigorous cool-season grass best known for its ability to rapidly establish an attractive turf stand within a short time of seeding. The development of improved perennial ryegrass cultivars continues at the New Jersey Agricultural Experiment Station as well as at other research stations. The incorporation of new germplasm collections from Western and Eastern Europe is allowing turf breeders to expand the genetic base of perennial ryegrass used in cultivar development. International collection trips are also being made in an effort to acquire new sources of germplasm containing the beneficial fungus endophyte. The presence of a *Neotyphodium lolii* endophyte found in many ryegrasses has enhanced insect resistance and stress tolerance. Turfgrass breeders and university professors are continuing to research the beneficial role of endophytes in turfgrass cultivar development.

## PROCEDURES

Eight perennial ryegrass trials were established between 1998 and 2002. Seven of the tests were seeded at Adelphia, NJ (Tables 1, 2, 4 to 8) and one test was seeded at North Brunswick, NJ (Table 3). The seven Adelphia tests were hand sown with 0.88 oz of seed into 3 X 5 ft plots (3.7 lb seed/1000 ft<sup>2</sup>). The North Brunswick test (Table 3) was hand sown with 2.1 oz into 3.5 X 5.5 ft plots (6.8 lb seed /1000 ft<sup>2</sup>). All tests were arranged in a randomized complete block design with three replications, and plots had 6-inch unseeded borders to limit contamination.

All tests located at Adelphia (Tables 1, 2, 4 to 8) received a fall application of the postemergence herbicides 2, 4-D and Banvel for broadleaf weed control. A spring application of Dimension was used for preemergence control of summer annuals. The 1999,

2000, and both 2001 Adelphia tests were also treated with a July application of Merit for grub control and an August application of Dimension for *Poa annua* control. In the spring of 2002, Dimension was used on the 1999 North Brunswick test (Table 3) for preemergence control of summer annual weeds. In addition, a July application of Merit for grub control, an August application of Chipco for Dollar spot control, and an August application of Drive for postemergence crabgrass control were applied to the North Brunswick test (Table 3). Two fall applications of Prograss were also made to the North Brunswick test for *Poa annua* control.

The annual rate of nitrogen and mowing height for each test is presented in Table 9. Single applications of fertilizer did not exceed 1.0 lb nitrogen/1000 ft<sup>2</sup>. The amount and timing of nitrogen applied to turf varied to encourage disease and other stresses. Tests were mowed regularly with reel mowers to maintain a 1.5 inch height of cut. Rotary mowers were occasionally used to remove reproductive tillers. Based on soil test results, tests were limed as needed to maintain a pH of 6.0 to 6.5. All tests were irrigated when necessary to avoid drought stress.

All tests were rated throughout the growing season for visual turf quality (i.e., overall appearance, turf color, uniformity, density, mowing quality, reduced rate of vertical growth, leaf texture, and freedom from insect and disease damage). Other ratings such as establishment, spring green-up, color, density, leaf texture, and disease damage were rated when significant differences were evident. All ratings were based on a 1 to 9 scale, with 9 representing the best turf characteristic. Plots were evaluated by a number of turfgrass specialists to reduce the impact of personal bias for particular characteristics. All data were summarized and subjected to an analysis of

<sup>1</sup>Head Greenhouse and Field Technician, Professor, Professor, Turfgrass Research Farm Supervisor, Assistant Professor, Graduate Assistant, Principal Laboratory Technician, and Principal Laboratory Technician, respectively, New Jersey Agricultural Experiment Station, Cook College, Rutgers, The State University of New Jersey, New Brunswick, NJ 08901-8520.

variance. Means were separated using the least significant difference (LSD) multiple comparisons test.

## RESULTS AND DISCUSSION

Results for all tests are presented in Tables 1 through 8. Except for the 2002 trial at Adelphia (Table 8), entries in these tables are ranked according to their overall (multi-year) quality average. A high quality average is generally indicative of better disease resistance, a darker green color, greater density, uniformity, finer leaf texture, lower growth habit, improved mowing quality, and less damage due to insects. Tables 2 and 3 include entries of the 1999 National Perennial Ryegrass test sponsored by the National Turfgrass Evaluation Program (NTEP).

### Turf Quality

Considerable improvements have been made on the overall quality of turf type perennial ryegrass over the last 40 years. Newer perennial ryegrasses such as All\*Star2, Amazing, Applaud, Arrival, Mach 1, and Pizzazz as well as many promising experimentals have darker green color, more uniform appearance, increased density, lower growth habit, cleaner mowing and better tolerance to disease and insects.

### Establishment

Perennial ryegrass has become increasingly popular on home lawns, golf courses, and athletic fields because of its ability to rapidly establish an attractive turf stand. It is evident in Tables 6 and 8 that most cultivars were well established within a month or two after seeding. Seedling vigor can be affected by factors such as genetics, seed quality, the environment, after ripening dormancy and management procedures.

### Disease

Many of the newly developed perennial ryegrasses are showing significant differences in disease resistance and recovery. New Jersey provides excellent environmental conditions for the development of diseases such as red thread, dollar spot, and certain strains of rusts that attack perennial ryegrass as well as many other turf species. Table 3 provides valuable data on dollar spot and indicates that many experimental lines and new varieties have either bet-

ter disease resistance or a better ability to recover more rapidly from this disease.

Gray leaf spot can be a devastating disease on newly established turf stands of perennial ryegrass. The data in Tables 6 and 8 is very significant because little or no stable resistance to gray leaf spot has been shown to date by any turf-type perennial ryegrass. In September of 2001, a gray leaf spot epidemic occurred on the August 2001 planting of the perennial ryegrass test at Adelphia, NJ (Table 6). In September 2002, another outbreak of gray leaf spot occurred on the same test and there were considerable deviations in disease resistance from the 2001 epidemic. Most cultivars and selections had better resistance to the disease; there were, however, a small number of cultivars that were less resistant than previously reported.

In August 2002, a perennial ryegrass test was established at Adelphia, NJ (Table 8) and maintained to encourage a gray leaf spot epidemic, which did occur. The data in Table 8 is ranked by gray leaf spot average instead of turf quality due to the severity of the disease on the trial. Newer experimentals such as MM1, MS1, MS2, and 12001 had excellent resistance to the disease. Many other experimentals also showed very good resistance and recovery from gray leaf spot.

### Other Turf Characteristics

The color ratings in Tables 2 and 3 indicate that newer cultivars and selections such as Applaud, Kokomo, and Pizzazz possess a much darker green color than older cultivars such as Linn, Manhattan, or Pennfine. However, spring green-up ratings in March 2002 (Table 2) and April 2002 (Table 3) indicate that many of the newer perennial ryegrasses that have better color were slower to come out of winter dormancy. Improvements are also shown in leaf texture and turf density ratings represented in Table 3. Newer cultivars also show improved leaf texture and turf density (Table 3).

### SUMMARY

Although significant improvements have been made on perennial ryegrasses, increased genetically stable resistance to gray leaf spot, crown rust, dollar spot, pink patch, red thread, and brown patch is still

needed. In addition, increased heat tolerance, cold hardiness, and the ability to survive under ice sheets for extended periods are also necessary.

#### **ACKNOWLEDGMENTS**

New Jersey Agricultural Experiment Station Publication No. D-12180-4-03. This work was conducted

as a part of NJAES Project No. 12264, supported by New Agricultural Experiment Station, State and Hatch Act funds, Rutgers Center for Turfgrass Science, other grants and gifts. Additional support was received by the New Jersey Turfgrass Association, the New Jersey Turfgrass Foundation, and the National Turfgrass Evaluation Program.
