Rutgers Cooperative Extension

2009 RUTGERS TURFGRASS PROCEEDINGS

of the

**New Jersey Turfgrass Expo
December 8-10, 2009
Trump Taj Mahal
Atlantic City, New Jersey**

The Rutgers Turfgrass Proceedings is published yearly by the Rutgers Center for Turfgrass Science, Rutgers Cooperative Extension, and the New Jersey Agricultural Experiment Station, School of Environmental and Biological Sciences, Rutgers, The State University of New Jersey in cooperation with the New Jersey Turfgrass Association. The purpose of this document is to provide a forum for the dissemination of information and the exchange of ideas and knowledge. The proceedings provide turfgrass managers, research scientists, extension specialists, and industry personnel with opportunities to communicate with co-workers. Through this forum, these professionals also reach a more general audience, which includes the public.

This publication includes lecture notes of papers presented at the 2009 New Jersey Turfgrass Expo. Publication of these lectures provides a readily avail-

able source of information covering a wide range of topics and includes technical and popular presentations of importance to the turfgrass industry.

This proceedings also includes research papers that contain original research findings and reviews of selected subjects in turfgrass science. These papers are presented primarily to facilitate the timely dissemination of original turfgrass research for use by the turfgrass industry.

Special thanks are given to those who have submitted papers for this proceedings, to the New Jersey Turfgrass Association for financial assistance, and to Barbara Fitzgerald and Anne Diglio for administrative and secretarial support.

Dr. Ann Brooks Gould, Editor

PERFORMANCE OF KENTUCKY BLUEGRASS CULTIVARS AND SELECTIONS IN NEW JERSEY TURF TRIALS

Melissa M. Wilson, Robert R. Shortell, William K. Dickson, Ronald F. Bara, Dirk A. Smith,
Eric N. Weibel, Joseph B. Clark, James A. Murphy, Stacy A. Bonos,
and William A. Meyer¹

Kentucky bluegrass (*Poa pratensis* L.) is one of the most widely used and well known cool-season turfgrasses in the northern United States and Canada. Kentucky bluegrass creates a high quality lawn and is now available in many different blend formulations. Kentucky bluegrass has a moderate growth pattern and spreads by underground stems called rhizomes. The extensive rhizome system of this turfgrass provides excellent sod strength as well as the ability to recuperate after stress periods and fill in damaged areas quickly. Although the turfgrass does poorly in extremely shady areas, it has the ability to adapt to a wide range of soils and climates in areas with full sun to part shade. The grass will become dormant in hot, dry weather as well as during the cold winter months.

Kentucky bluegrass has become an increasingly popular species for use on sports turf where safety and playability are of utmost importance. Due to this demand, Kentucky bluegrasses have been tested throughout the country for tolerance to traffic and low mowing heights to determine which cultivars can tolerate current golf course fairway conditions. Since Kentucky bluegrass reproduces through an asexual process called apomixis, any improvement to cultivar performance is challenging. The advantage of apomixis is that it provides the opportunity to utilize hybrid vigor and produce true-to-type seed from superior plants generation after generation. Over the past several decades, more than 200 cultivars of Kentucky bluegrass have been released.

Texas bluegrass, native to Texas and parts of Oklahoma, is a dioecious species that is more tolerant of heat and drought stress than Kentucky bluegrass. The breeding strategy of crossing female Texas bluegrass plants with Kentucky bluegrass could expand the adaptation of Kentucky bluegrass into transition

zone areas where better heat and drought tolerance is needed. Turfgrass breeders continue to broaden the genetic base of Kentucky and Texas bluegrass by collecting grasses from around the world. This has lead to a large number of new Kentucky bluegrass cultivars with novel traits. In addition, the turfgrass research program at Rutgers participates in the National Turfgrass Evaluation Program (NTEP), sponsored by the USDA Beltsville Agricultural Research Center and the National Turfgrass Federation, Inc. This program coordinates nationwide testing of turfgrass cultivars and selections to determine performance across many environments where turfgrass can be grown.

PROCEDURES

Eight Kentucky bluegrass trials were seeded from 2005 to 2008. Four of the tests (Tables 1, 3, 5, and 7) were seeded at the Rutgers Plant Biology and Pathology Research and Extension Farm at Adelphia, NJ and four tests (Tables 2, 4, 6, and 8) were established at the Rutgers Horticultural Research Farm II in North Brunswick, NJ. The trials represented in Tables 1 to 5 and 7 were maintained as medium-high maintenance tests. The trial presented in Table 8 was intended to be maintained as a low maintenance test; it did, however, receive more nitrogen than other tests at the North Brunswick location to encourage the Kentucky bluegrass to crowd out the annual bluegrass (*Poa annua*) that had encroached during establishment.

Entries in each test were sown by hand using a maximum of 0.53 oz of seed per 3 x 5 ft plot (2.2 lb/1000 ft²). Each test was arranged in a randomized complete block design with three replications. Annual nitrogen applied and mowing heights for each trial are presented in Table 9. The amount of nitrogen applied varied between tests to encourage disease as well

¹Field Researcher IV, Graduate Assistant, Turfgrass Research Farm Supervisor, Principle Laboratory Technician, Principle Laboratory Technician, Field Researcher IV, Principle Laboratory Technician, Extension Specialist in Turfgrass Management, Assistant Professor, and Research Professor, respectively, New Jersey Agricultural Experiment Station, School of Environmental and Biological Sciences, Rutgers, The State University of New Jersey, New Brunswick, NJ 08901-8520.

as assist in the recovery of some diseases and other stresses. No single nitrogen application exceeded 0.75 lb/1000 ft². All tests were mowed frequently to avoid scalping and the accumulation of clippings. Reel mowers were used to maintain a height of 1.5 inches on the trials represented in Tables 1 to 7. A rotary mower was used on the test in Table 8 at the height of 3 inches.

After establishment, annual weeds were controlled using a spring and summer application of Dimension and broadleaf weeds were controlled with a fall or spring application of 2,4-D, dicamba, or MCPP. Merit was applied in August to control grubs on all tests presented. Depending on soil test results, soil pH was maintained between 6.0 and 6.5 with granular dolomitic limestone. Tests were irrigated during establishment and also when needed to avoid severe drought stress with the exception of the 2008 New Brunswick test in Table 8, which was not watered at all in 2009.

All tests were rated frequently throughout the growing season for turf quality. Turf quality includes color, brightness, leaf texture, density, uniformity, damage due to diseases and insects, and overall attractiveness of the plot. Other characteristics evaluated separately when differences became evident included spring green-up (Tables 1 and 8), establishment (Tables 7 and 8), color (Table 1), dollar spot (Tables 1, 3, and 5), summer patch (Tables 2, 4, and 6), both stem and crown rusts (Table 7), damage due to Tenacity herbicide (Table 7), and seed heads (Table 7). All ratings were based on a 1 to 9 scale, where 9 represented the most favorable turf quality or desirable turf characteristic. Ratings were conducted by a number of researchers throughout the season to reduce personal preferences toward particular traits.

RESULTS

Results are presented in Tables 1 through 8. Entries are ranked according to their overall (multi-year) quality average. As conditions permit, additional characteristics are observed in various tests and recorded when differences were most significant.

Establishment

Kentucky bluegrass is one of the slowest cool-season grasses to establish a mature stand. Establishment can be influenced by factors such as

genetics, seed quality, environment, management practices, and after-ripening dormancy. Caution should be exercised when interpreting the seedling vigor and establishment data of a given cultivar. After-ripening dormancy in newly harvested seed can significantly affect stand establishment. Other characteristics that affect establishment and seedling vigor include age of the seed, storage conditions, and environmental conditions at the time of seeding.

Spring Green-up

This trait indicates the wide range of genetic diversity within Kentucky bluegrass. The data presented in Tables 1 and 8 shows that cultivars such as Argos, Eagleton, Juliet, Mystere, and Skye were actively growing in the end of April 2009. Cultivars that were typically late to green up include Everest, Everglade, Solar Eclipse, Midnight, and NuDestiny. Many of the cultivars and selections that are specifically adapted to New Jersey and the mid-Atlantic region, such as Cabernet, Eagleton, and RSP, typically have early spring green-up. Due to an increase in leaf elongation that occurs in response to increases in temperature and day length (Parsons and Robson, 1980), cultivars adapted to this region are more sensitive to these conditions and may green up earlier in the spring. Cultivars and selections that are adapted to higher latitudes need a more dramatic change in day length before spring growth is initiated.

Crown Rust

Crown rust (caused by the fungus *Puccinia coronata*) is a serious disease on some Kentucky bluegrass varieties. The symptoms of rust are small yellow or brown spots on leaves that enlarge and increase in number until entire leaves are affected. Masses of bright orange spores develop on the lesions. Affected leaves die slowly, giving the turf a yellow to brown appearance. Varieties such as Blue Note, Blueberry, and Bewitched as well as some promising experimentals showed excellent resistance to crown rust (Table 7).

Stem Rust

Stem rust (caused by the fungus *Puccinia graminis*) is also a severe disease of some Kentucky bluegrasses. At the onset of stem rust, the turf can often appear yellow. As the disease progresses a closer look at the turf shows prevailing symptoms as brick-red flecks on leaf and stem tissues. In July 2009, the 2008 Kentucky bluegrass test at Adelphia

(Table 7) experienced an epidemic of stem rust. Nitrogen was withheld from the test during that time to record differences in severity and recovery. Some Kentucky bluegrass cultivars and selections with good, consistent resistance to stem rust included A00-1400, Blue Note, Bewitched, and Freedom II as well as other promising experimentals.

Dollar Spot

Dollar spot (caused by the fungus *Sclerotinia homoeocarpa*) is another disease that is common in Kentucky bluegrass. The name dollar spot comes from the silver dollar-sized, light-tan or grayish spots that occur on bentgrass putting greens. However, in turfgrasses mowed at raised heights, dollar spot can be seen as 4- to 6-inch patches of straw colored turf. Affected areas may merge and become large as the disease spreads. Dollar spot can be severe when nitrogen fertilization is less than optimum. Dollar spot is usually evident during periods of warm days and cool nights that produce dew and high humidity in the turf canopy. Cobweb-like mycelium can be found growing on the grass blades. Results in Tables 1, 3, and 5 indicate that many of the newer Kentucky bluegrass varieties on the market today have very good resistance to this particular disease.

Summer Patch

Summer patch (caused by the fungus *Magnaporthe poae*) generally occurs between June and September. The disease begins as scattered small round patches of thin, wilted or slow growing turf. As the patches enlarge, they may join together and form pockets of yellow turf. The leaves and crowns of infected plants may appear to be dark brown as the dark mycelium of the fungus invades the tissue. The tests presented in Tables 2 and 6 indicate that varieties such as Cabernet, Prosperity, Diva, and Mystere as well as many experimentals show excellent resistance to this disease.

CLASSIFICATION OF KENTUCKY BLUEGRASSES

Compact Type

Cultivars within this group are characterized by a low, compact growth habit and very good to excellent resistance to leaf spot. Most cultivars form a highly attractive turf after green-up in late spring. In general, Compact Type cultivars have long winter dormancy

and a purple coloration can be observed on many during cold weather.

Compact-Midnight Type

Within the Compact Type, a number of cultivars exhibit growth and performance characteristics that are similar to the cultivar Midnight. In general, these cultivars have long winter dormancy and a purple and/or straw coloration during prolonged dormant periods. Members of this group typically green up late in the spring, are very dark green, and turf quality is good.

Compact-America Type

Within the Compact Type, a number of cultivars have growth and performance characteristics that are similar to the cultivar America. Compared to other Compact Type cultivars, these grasses have a finer leaf texture and higher density. Members of this group exhibit moderate winter dormancy, often accompanied by yellowing or bleaching of leaf tips.

Mid-Atlantic Type

This group of cultivars is typified by a vigorous turf of medium-high density with a deep and extensive system of roots and rhizomes. In general, grasses in this group are moderately susceptible to leaf spot, but due to the deep rhizome characteristic, recover well from damage due to this disease and other stresses. These cultivars are tolerant of summer stress and exhibit moderate to good winter performance.

High Density Type

This group of cultivars, formerly known as the Aggressive Type, was recently reclassified (Shortell et al., 2009). The two characteristics shared by members of this type are high shoot density and aggressive lateral growth (Bonos et al., 2000), which can hasten the development of a mature sod. High Density cultivars may dominate other species or cultivars when used in blends or mixtures, leading to rapid expression of the cultivar's strengths and weaknesses.

Julia Type

This group is typified by the performance characteristics of the cultivar Julia. Cultivars in this group tend to have good wear tolerance.

Shamrock Type

Cultivars within this type exhibit characteristics that are similar to the cultivar Shamrock. Although members of this group tend to exhibit moderate winter color and moderate resistance to leaf spot, they also have high seed yield potential.

BVMG Type (Baron, Victa, Merit, Gnome Type)

This widely used group of cultivars has very high seed yield potential and can generally produce medium to good quality turf when stripe smut is not present. These cultivars have medium-low growth, medium wide leaves, and produce a medium-dense turf. Reproductive stems are often visible in turf plots due to seed head formation in late spring.

Common Type

These cultivars and selections are frequently referred to as "common" Kentucky bluegrasses and are characterized by an erect growth habit and narrow leaf blades. The Common Type should not be confused with the term "variety-not not stated" (or "VNS") used on seed labels; unfortunately, the term "common" is often used to inaccurately describe VNS seed. These cultivars produce seed early and economically, exhibit good stress tolerance, and often survive summer drought in a dormant condition; unfortunately, poor turf quality and excessive purple coloration during winter is typical. Common Type cultivars are best adapted to high cutting heights in regions with cool nights, bright sun, and low humidity. They are also suited for low maintenance utility turf areas where soil stabilization and conservation are needed. Common type bluegrasses often show poor resistance to leaf spot disease.

Other Turf Types

This group of cultivars and selections possess traits that are intermediate between two or more of the previously discussed groups. Further study may permit reclassification of some of these cultivars into known groups or the separation of additional types.

SUMMARY

Kentucky bluegrass is grown for many uses under a diverse range of soil, environmental, and management conditions. As a result, there is a demand for cultivars that produce a durable, high quality turf for an assortment of uses under a broad range of conditions. Improved resistance to important disease and insect pests, heat, drought, close mowing, shade, and wear is needed in cultivars that are expected to perform well in many situations. One of the greatest challenges to date is the development of better adapted, high quality cultivars with high seed yields that are acceptable to commercial producers.

ACKNOWLEDGMENTS

New Jersey Agricultural Experiment Station Publication No. E-12180-03-10. This work was conducted as part of NJAES Project No. 12180, supported by the New Jersey Agricultural Experiment Station, State, and Hatch Act Funds, the Rutgers Center for Turfgrass Science, other grants, and gifts. Additional support was received from the United States Golf Association, the National Turfgrass Evaluation Program, and the New Jersey Turfgrass Association.
