The Rutgers Turfgrass Proceedings is published yearly by the Rutgers Center for Turfgrass Science, Rutgers Cooperative Extension, and the New Jersey Agricultural Experiment Station, School of Environmental and Biological Sciences, Rutgers, The State University of New Jersey in cooperation with the New Jersey Turfgrass Association. The purpose of this document is to provide a forum for the dissemination of information and the exchange of ideas and knowledge. The proceedings provide turfgrass managers, research scientists, extension specialists, and industry personnel with opportunities to communicate with co-workers. Through this forum, these professionals also reach a more general audience, which includes the public.

This publication includes lecture notes of papers presented at the 2012 GREEN EXPO Turf and Landscape Conference. Publication of these lectures provides a readily available source of information

covering a wide range of topics and includes technical and popular presentations of importance to the turfgrass industry.

This proceedings also includes research papers that contain original research findings and reviews of selected subjects in turfgrass science. These papers are presented primarily to facilitate the timely dissemination of original turfgrass research for use by the turfgrass industry.

Special thanks are given to those who have submitted papers for this proceedings, to the New Jersey Turfgrass Association for financial assistance, and to Barbara Fitzgerald, Anne Diglio, and Ann Jenkins for administrative and secretarial support.

Fungicides were evaluated in 2012 for their ability to control dollar spot (caused by *Sclerotinia homoeocarpa*) at the Rutgers Turf Research Farm in North Brunswick, NJ on creeping bentgrass (*Agrostis stolonifera*) maintained under golf course greens conditions. Turf was established September 2007 on a Nixon loam with a pH of 6.3. Mowing was performed daily at a height of 0.125 inches with clippings collected. The site was irrigated as needed to prevent drought stress. Plots were 3 x 5 ft and were arranged in a randomized complete block with four replications.

Fertilizer was applied as 20-20-20 (0.25 lb nitrogen (N) per 1000 ft<sup>2</sup>) on 21 April and 5 June; 46-0-0 (0.2 lb N per 1000 ft<sup>2</sup>) on 9, 14, and 26 May; 46-0-0 (0.1 lb N per 1000 ft<sup>2</sup>) on 18 and 25 June, 4, 19, and 29 July, and 13 and 30 August; 0-30-0 (0.025 lb phosphorus (P) per 1000 ft<sup>2</sup>) sprayed on 10, 11, and 24 July, 8 and 21 August, and 8 September; 0-0-62 (0.05 lb potassium (K) per 1000 ft<sup>2</sup>) on 11 and 24 July, and 8 and 21 August; and Microgreen (micronutrient mixture; 0.4 fl oz product per 1000 ft<sup>2</sup>) on 25 June, 4 and 29 July, and 30 August.

ProStar 70W (3.0 oz per 1000 ft<sup>2</sup>) was applied on 26 July to control brown patch (caused by *Rhizoctonia solani*). Localized dry spots were suppressed with the wetting agent Tricure 100LC (6.0 fl oz per 1000 ft<sup>2</sup>) on 5 June and Tricure 100LC (1.0 fl oz per 1000 ft<sup>2</sup>) on 4, 11, 19, 24, and 29 July, 8, 13, 21, and 30 August, and 8 September. Post-emergence crabgrass (*D. sanguinalis*) control was achieved with Acclaim Extra 0.57SC (3.5 fl oz per acre) on 7 and 19 June and 1 and 17 July. Insect pests were controlled with Acelepryn 1.67SC (3.0 fl oz per acre) on 6 July. Turf was topdressed with sand (1 ft<sup>3</sup> per 1,000 ft<sup>2</sup>) on 4 and

27 April, 23 June, 9 July, and 7 August to maintain surface uniformity and turf quality.

Fungicides were applied in water equivalent to 1.9 gal per 1000 ft<sup>2</sup> with a CO<sub>2</sub> powered sprayer at 30 psi using TeeJet 8003VS flat fan nozzles. Treatments (trt) were initiated on 10 May when environmental conditions were conducive to dollar spot development. Fungicides were reapplied at the appropriate intervals as indicated in Tables 1A to 1D. Turf was visually evaluated for number of dollar spot infection centers per plot on 23 May, 1, 11, and 21 June, 1, 11, 21, and 31 July, 10, 20, and 30 August, and 9 September. Turf quality was rated on 8 June, 6 July, 5 August, and 9 September using a 1 to 9 scale, where 9 = best turf quality and 5 = acceptable quality. Phytotoxicity was assessed on 6 July and 5 August using a 1 to 5 scale, where 1 = no foliar discoloration, 2 = slight chlorosis or necrosis, 3 = moderate chlorosis or necrosis, 4 = severe chlorosis or necrosis, and 5 = all turf dead. Color of foliage was visually estimated on 8 June, 6 July, and 5 August using a 1 to 5 scale, where 1 = very chlorotic turf, 2 = slight reduction in green color, 3 = normal green color of healthy turf, 4 = slight dark green color, and 5 = very dark green color. Percent soil surface covered with blue-green algae (cyanobacteria) was assessed on 20 July. Data were subjected to analysis of variance and means were separated using the Waller-Duncan k-ratio t-test (k = 100).

Dollar spot was first observed on 18 May and became uniform throughout the study by 23 May (Table 1A). The disease progressed rapidly during June, July, and August, peaking on 9 September at 249 lesion centers per plot on untreated turf (Table 1A). This was considered a very high level of dollar

spot infestation and thus a stringent test of the ability of a product to control this disease under commercial golf course greens conditions. Less than 10 infection centers per plot represented an acceptable level of disease control for this study.

Season-long control of dollar spot (10 May to 9 September; 38 days after the last application, Tables 1A and 1B) was afforded turf treated with HM0812 1.66SC @ 2.4 fl oz (trt 15), Xzemplar 2.5SC @ 0.211 fl oz every 21 days (trt 29), Emerald 70WG @ 0.18 oz every 21 days (trt 30), Lexicon Intrinsic 4.17SC @ 0.34 fl oz 21 days (trt 32), Honor Intrinsic 28WG @ 0.84 oz every 21 days (trt 33), BASF 2012 \$-Spot Greens Program #3 (trt 37), Reserve 4.8SC @ 2.5 fl oz every 7 days (trt 41), and Concert II 4.3SE (trt 43). Excellent residual control (28 days after the last treatment) was also afforded by SA-0010222 SC (trt 4), Emerald 70WG @ 0.13 oz every 14 days (trt 10), Headway 1.39EC (trt 11), HM0812 1.66SC @ 1.5 fl oz (trt 13) and 2.0 fl oz (trt 14), Xzemplar 2.5SC @ 0.157 fl oz every 14 days (trt 28), BASF 2012 \$-Spot Greens Programs #2 (trt 36), #4 (trt 38), and #5 (trt 39), RU192514-12Q SC + RU192514-12J SC (trt 54), Daconil Action 6.1SC @ 3.5 fl oz + Appear 4.1SL @ 6.0 fl oz (trt 57), Concert II 4.3SE + Appear 4.1SL (trt 58), A13703G 2.7SC + Daconil Action 6.1SC (trt 62), Emerald 70WG @ 0.18 oz applied every 28 days on a curative basis (trt 81), Velista 50WDG @ 0.5 oz (trt 83), Velista 50WDG + Daconil Ultrex 82.5WDG (trt 84), Velista 50WDG + Curalan 50EG (trt 85), QP Enclave 5.3F @ 4.0 fl oz + QP Fosetyl-Al 80WG @ 4.0 oz + Foursome 100SL @ 0.4 fl oz every 21 days (trt 90), and Echo 6F ETQ + SA-0010234 SC (trt 96).

Other fungicide entries that provided good to excellent control of dollar spot, but only through the application period (10 May to 16 August; see evaluation date 20 August, Table 1B) included HM0812 1.66SC @ 1.2 fl oz every 14 days (trt 12), BASF 2012 \$-Spot Greens Prog. #6 (trt 40), Tourney 50WG (trt 44), Interface 2.27SC @ 3.0 fl oz (trt 45) and 4.0 fl oz (trt 46), Daconil Action 6.1SC @ 3.5 fl oz + Appear 4.1SL @ 4.0 fl oz (trt 56), A13703G 2.7SC + Appear 4.1SL (trt 59), Daconil Ultrex 82.5WDG @ 3.2 oz +

Chipco Signature 80WG @ 4.0 fl oz (trt 61; one of the standard fungicide combinations used to control anthracnose), QP Enclave 5.3F @ 3.0 fl oz + QP Fosetyl-Al 80WG @ 4.0 oz + Foursome 100SL @ 0.4 fl oz every 14 days (trt 89), and Insignia Intrinsic 2.1SC (trt 93).

Turf quality was acceptable (greater or equal to 5.0) for most entries in this study. In general, turf treated with products that provided poor dollar spot control exhibited unacceptable turf quality on at least half of the evaluation dates [e.g., trts 3, 6 to 8, 16, 18, 19, 24, 27, 47, 50, 52, 63 to 66, 68, 75 to 79, 86 to 88, and 92] (Table 1C). Slight phytotoxicity was observed in July and/or August (see Table 1C) for turf treated with Headway 1.39EC (trt 11), HM0812 1.66SC (trts 12 to 15), Concert II 4.3SE (trt 43), Daconil Ultrex 82.5WDG (trt 95), and Echo 6F ETQ + SA-0010234 SC (trt 96).

Several treatments resulted in visually darker green foliage compared to untreated turf (trt 97) on at least 50% of the evaluation dates [i.e., SA-0010233 SC (trt 2), HM0812 1.66SC @ 2.0 fl oz (trt 14) and 2.4 fl oz (trt 15), Reserve 4.8SC @ 2.5 fl oz every 7 days (trt 41), Interface 2.27SC @ 4.0 fl oz (trt 46), Concert II 4.3SE + Appear 4.1SL (trt 58), A12531R + Chipco Signature 80WG (trt 60), QP Enclave 5.3F + QP Fosetyl-Al 80WG + Foursome 100SL (trts 87, 88), and QP Enclave 5.3F + QP Fosetyl-Al 80WG + Foursome 100SL (trt 89, 90)], presumably because they either contain a pigment, a plant growth regulator, and/or a fertilizer (Table 1D).

Algae was observed in the study on 20 July. Treatments 2, 4, 6, 8, 54, 63 to 67, 76, 78 and 79, as well as several products containing chlorothalonil, fluazinam, iprodione, mancozeb, a phosphonate, and/or vinclozolin (i.e., trts 1, 7, 9, 16, 18, 22, 24, 27, 35 to 43, 47 to 49, 51, 53, 55 to 62, 84, 85, 87 to 91, 95, 96) reduced algae compared to the untreated control; whereas a few products and product combinations increased the percentage of the soil surface covered with algae (i.e., trts 12 to 15, 31, 32, 68, 71, 73, 74, 83, 86, and 94); presumably because these products reduced stand density Table 1D).
