Atlantic City, New Jersey

The Rutgers Turfgrass Proceedings is published yearly by the Rutgers Center for Turfgrass Science, Rutgers Cooperative Extension, and the New Jersey Agricultural Experiment Station, School of Environmental and Biological Sciences, Rutgers, The State University of New Jersey in cooperation with the New Jersey Turfgrass Association. The purpose of this document is to provide a forum for the dissemination of information and the exchange of ideas and knowledge. The proceedings provide turfgrass managers, research scientists, extension specialists, and industry personnel with opportunities to communicate with co-workers. Through this forum, these professionals also reach a more general audience, which includes the public.

This publication includes lecture notes of papers presented at the 2013 GREEN EXPO Turf and Landscape Conference. Publication of these lectures provides a readily available source of information

covering a wide range of topics and includes technical and popular presentations of importance to the turfgrass industry.

This proceedings also includes research papers that contain original research findings and reviews of selected subjects in turfgrass science. These papers are presented primarily to facilitate the timely dissemination of original turfgrass research for use by the turfgrass industry.

Special thanks are given to those who have submitted papers for this proceedings, to the New Jersey Turfgrass Association for financial assistance, and to Barbara Fitzgerald, Anne Diglio, and Ann Jenkins for administrative and secretarial support.

CONTROL OF DOLLAR SPOT ON A CREEPING BENTGRASS GREEN WITH FUNGICIDES AND BIORATIONAL PRODUCTS, 2013

Bruce B. Clarke, Pradip R. Majumdar, Lisa Beirn, Samantha Flatley, Gerard Rappa, Michael Mus, Mark Peacos, Tracy J. Lawson, Charles Schmid, and James Hempfling¹

Fungicides were evaluated in 2013 for their ability to control dollar spot (caused by *Sclerotinia homoeocarpa*) at the Rutgers Turf Research Farm in North Brunswick, NJ on creeping bentgrass (*Agrostis stolonifera*) maintained under golf course greens conditions. Turf was established September 2010 on a Nixon loam with a pH of 6.2. Mowing was performed daily at a height of 0.125 inches with clippings collected. The site was irrigated as needed to prevent drought stress. Plots were 3 x 5 ft and were arranged in a randomized complete block with four replications.

Fertilizer was applied as 46-0-0 (0.4 lb nitrogen (N) per 1000 ft²) on 26 March, 46-0-0 (0.1 lb N per 1000 ft²) on 22 April, 6 and 20 May, 4 and 17 June, 2, 15, and 27 July, and 2 and 26 August, and 20-20-20 (0.1 lb N per 1000 ft²) on 6 May. Phosphorus (P) was applied as 0-30-0 (0.05 lb P per 1000 ft²) on 26 March, 4 Jun, 2 and 27 July, and 26 August. Potassium (K) was sprayed as 0-0-62 (0.1 lb K per 1000 ft²) on 6 April, 15 and 17 June, 15 July, and 12 and 26 August. Micronutrients were sprayed as Micro Green (micronutrient solution containing 5% iron, 0.5% manganese, 0.5% copper, 0.5% zinc, and 2% sulfur; 4.0 fl oz per 1000 ft²) on 21 March, 12 April, and 20 May. Calcium (Ca) was applied as Sugar Cal (10% Ca solution; 4.0 fl oz per 1000 ft²) on 27 April, 30 May, 29 June, 26 July, and 20 August, and magnesium (Mg) (4% solution; 4.0 fl oz per 1000 ft²) was sprayed on 21 March, 22 April, 20 May, 17 June, 12 July, and 12 August. QuickSilver 1.9L was applied on 27 April and 14 May (0.154 fl oz per 1000 ft²) and 15 June, 4 and 15 July, and 5 August (0.046 fl oz per 1000 ft²) for silvery thread moss (*Bryum argenteum*)

control. Heritage TL 0.8ME (2.0 fl oz per 1000 ft²) was applied on 5 July and 12 August to suppress brown patch (caused by *Rhizoctonia solani*). Localized dry spots were suppressed with the wetting agent Tricure 100LC (4.0 fl oz per 1000 ft²) on 4 May, 14 June, and 18 July. Insect pests were controlled with Acelepryn 1.67SC (3.0 fl oz per A) on 16 June and Merit 75WP (0.16 oz per 1000 ft²) on 5 July. Turf was topdressed with sand (0.7 ft³ per 1000 ft²) on 19 April, 10 May, 17 June, 12 July, and 19 and 24 August.

Fungicides were applied in water equivalent to 1.9 gal per 1000 ft² with a CO₂ powered sprayer at 30 psi using 85025 air induction nozzles. Treatments (trt) were initiated on 28 May when environmental conditions were conducive to dollar spot development. Fungicides were reapplied at the appropriate intervals as indicated in Tables 1A, 1B, 1C, and 1D. Turf was visually evaluated for number of dollar spot infection centers per plot on 13 and 23 June, 3, 13, and 23 July, 2, 12, and 22 August, and 1 September. Turf quality was rated on 25 June, 23 July, and 20 August using a 1 to 9 scale, where 9 = best turf quality and 5 = acceptable quality. Phytotoxicity was assessed on 25 June, 23 July, and 20 August using a 1 to 5 scale, where 1 = no foliar discoloration, 2 = slight chlorosis or necrosis, 3 = moderate chlorosis or necrosis, 4 = severe chlorosis or necrosis, and 5 = all turf dead. Color of foliage was visually estimated on 25 June, 23 July, and 20 August using a 1 to 10 scale, where 5 = color of healthy untreated turf, less than 5 = progressively more chlorotic or necrotic turf, and greater than 5 = progressively darker green turf. Brown patch was evaluated as the percent turf area infected with *R. solani* on 7 July. Data were subjected

to analysis of variance and means were separated using the Waller-Duncan *k*-ratio *t*-test (*k* = 100).

Dollar spot was first observed on 3 June and became uniform throughout the study by 13 June (Table 1A). The disease progressed gradually throughout August, peaking on 1 September at 202 lesion centers per plot on untreated turf (Table 1B). This was considered a high level of dollar spot infestation and thus a stringent test of a product's ability to control this disease on a creeping bentgrass green. Less than 10 infection centers per plot represented an acceptable level of disease control for this study.

Season-long control of dollar spot (28 May to 1 September; 19 to 40 days after the last application, Tables 1A and 1B) was afforded by 19% of the treatments; these included RU-21196-13A SC every 14 days (trts 1, 2), RU-21196-13B SC @ 5.33 fl oz every 14 days (trt 3), 2013 Bayer Dollar Spot Greens Programs #1 (trt 9) and #2 (trt 10), RU-2125-123H SC every 7 days (trt 11), Interface 2.27SC (trt 23), Honor Intrinsic 28WG (trt 24), Insignia Intrinsic 2.1SC (trt 26), 2013 Sipcam Dollar Spot Greens Prog #3 (trt 32), Emerald 70WG @ 0.13 oz every 14 days (trt 38), RU-229225-13A LC @ 1.0 fl oz + RU-229225-13B LC @ 1.28 fl oz (trt 43), Encartis 6.24SC (trts 60, 61), Secure 4.17SC + Insignia Intrinsic 2.1SC every 14 days (trt 75), 2013 Dollar Spot Greens Prog #15 (trt 76), and Emerald 70WG @ 0.18 oz every 21 days (trt 84).

Other fungicide entries (44% of all treatments) provided good to excellent control of dollar spot throughout the application period (28 May to 20 August; see evaluation date 22 August, Table 1B); these included RU-21196-13A SC every 21 days (trt 4), RU-21196-13B SC every 21 days (trt 5), RU-21196-13C SC (trts 6, 7), RU-2125-123H SC every 14, 21, or 28 days (trts 12 to 16), RU-2125-123I SC every 7, 14, or 21 days (trts 18 to 20), SA-0290101 F (trt 27), SA-0290102 F (trt 28), Echo Dyad ETQ 6F (trt 29), SA-0010233 F (trt 30), SA-0010235 F (trt 33), Daconil Action 6.1SC (trt 37), Chipco Signature 80WG + Daconil Ultrex 82.5WDG (trt 39), RU-229225-13A LC 0.25 fl oz + RU-229225-13B LC 1.28 fl oz (trt 41), RU-229225-13A LC 0.5 fl oz + RU-229225-13B LC 1.28 fl oz (trt 42), QP Enclave 5.3F + Foursome 100SL (trts 48, 49), QP Enclave 5.3F + QP Fosetyl-Al 80WDG + Foursome 100SL (trts 50, 51), Xzemplar

Several treatments resulted in visually darker green foliage (greater or equal to a color rating of 5) on at least 50% of the evaluation dates [i.e., 2013 Bayer Dollar Spot Greens Prog #2 (trt 10), RU-2125-123H SC 28 days (trt 16), RU-2125-123I SC every 28 days (trt 21), SA-0010236 F (trt 25), Echo Dyad ETQ 6F (trt 29), SA-0010233 F (trt 30), 2013 Sipcam Dollar Spot Greens Prog #3 (trt 32), SA-0010235 F (trt 33), QP Enclave 5.3F + Foursome 100SL every 14 days (trts 48), QP Enclave 5.3F + QP Fosetyl-Al 80WDG + Foursome 100SL every 14 days (trt 50), K-1 LC @ 2.0 fl oz + Banner Maxx 1.3ME @ 1.0 fl oz (trt 58), 2013 NuFarm Dollar Spot Greens Programs #12 and 13 (trt 71, 72), and 2013 Dollar Spot Greens Programs #14 to 19 (trts 74, 76, 78, 79, 81, 82)], presumably because they either contain a pigment, a plant growth regulator, and/or a fertilizer (Table 1C).

Turf quality was acceptable (greater or equal to 5.0) for most entries in this study. In general, turf treated with products that provided poor dollar spot control exhibited unacceptable turf quality on at least half of the evaluation dates [e.g., 2013 Dollar Spot Greens Programs #5 and 6 (trts 46 and 47), Regalia 5LC (trt 52), RU 13118-13A LC (trts 53, 54), and RU 13118-13B LC + RU 13118-13A LC (trt 55)] (Table 1C). Very little phytotoxicity was observed for any of the treatments in this study. Only K-1 LC @ 2.0 fl oz + Banner Maxx 1.3ME @ 0.75 fl oz every 21 days (trt 59) exhibited slight foliar necrosis (up to 1.6 on a 1 to 5 scale) on more than half of the observation dates (Table 1D). Brown patch was observed in the study on 7 July. The majority of the entries (65%) provided acceptable control of this disease (Table 1D).
