2019 RUTGERS TURFGRASS PROCEEDINGS

of the

GREEN EXPO Turf and Landscape Conference

December 10-12, 2019

Borgata Hotel

Atlantic City, New Jersey

The Rutgers Turfgrass Proceedings is published yearly by the Rutgers Center for Turfgrass Science, Rutgers Cooperative Extension, and the New Jersey Agricultural Experiment Station, School of Environmental and Biological Sciences, Rutgers, The State University of New Jersey in cooperation with the New Jersey Turfgrass Association. The purpose of this document is to provide a forum for the dissemination of information and the exchange of ideas and knowledge. The proceedings provide turfgrass managers, research scientists, extension specialists, and industry personnel with opportunities to communicate with co-workers. Through this forum, these professionals also reach a more general audience, which includes the public.

This publication includes lecture notes of papers presented at the 2019 GREEN EXPO Turf and Landscape Conference. Publication of these lectures provides a readily available source of information

covering a wide range of topics and includes technical and popular presentations of importance to the turfgrass industry.

This proceedings also includes research papers that contain original research findings and reviews of selected subjects in turfgrass science. These papers are presented primarily to facilitate the timely dissemination of original turfgrass research for use by the turfgrass industry.

Special thanks are given to those who have submitted papers for this proceedings, to the New Jersey Turfgrass Association for financial assistance, and to Anne Diglio, Barbara Fitzgerald, and Nalini Kaul for administrative support.

PERFORMANCE OF PERENNIAL RYEGRASS CULTIVARS AND SELECTIONS IN NEW JERSEY TURF TRIALS, 2019

Jennifer Halterman, Ronald F. Bara, Dirk A. Smith, Ryan M. Daddio, Yuanshuo Qu,
Phillip L. Vines, Stacy A. Bonos, and William A. Meyer¹

INTRODUCTION

Perennial ryegrass (*Lolium perenne L.*) is a bunch-type, cool-season perennial grass native to mild climates in Asia, North Africa, and Europe (Beard, 1973; Terrell, 1968). It rapidly germinates, establishes quickly and grows best in moist, well-drained soils with a pH near 6.5 (Beard, 1973; Funk and Clarke, 1989; Thorogood, 2003). Perennial ryegrass performs well as a permanent turfgrass in parks, golf fairways and roughs, athletic fields, racetracks, and home lawns in mild climates (Beard, 1973; Beard and Beard, 2005; Thorogood, 2003). In warmer climates, it is used to overseed warm-season grasses during winter dormancy (Beard and Beard, 2005; Thorogood, 2003; Turgeon, 2008). It can also be used for roadsides for quick soil stabilization (Beard and Beard, 2005). Perennial ryegrass is susceptible to several fungal and oomycete diseases, but the Rutgers University Turfgrass breeding program selects for improvements in turf quality, disease resistance, seed yields, and increased tolerance against environmental stress factors (Bonos and Huff, 2013; Thorogood, 2003).

The Rutgers turfgrass breeding program began in 1961, released its landmark perennial ryegrass cultivar, 'Manhattan', in 1967, and became the largest cool-season turfgrass breeding program releasing more than 400 cultivars by 2010 (Funk et al., 1969; Funk and Meyer, 2001; Honig, 2011). Rutgers turfgrass breeding program started out small, having only limited worldwide resources of perennial ryegrass germplasm, but began diversifying and improving the germplasm in 1996 by collecting from countries throughout Europe and Asia (Thorogood, 2003; Bonos et al., 2004; Honig, 2011). These collections focus on isolating and identifying new sources of disease resistance that can be introduced to elite NJAES perennial ryegrass to test and improve resistance creating better cultivars.

Turfgrass breeding efforts at NJAES are focused on resistance against a number of fungal and oomycete diseases such as gray leaf spot (*Pyricularia oryzae*), stem rust (*Puccinia graminis* subsp. *graminicola*), crown rust (*Puccinia coronata*), and dollar spot (*Clareireedia jacksonii*) (Bonos and Huff, 2013; Bonos et al., 2006; Salgado-Salazar et al., 2018). Additional diseases include anthracnose (*Colletotrichum cereale*), brown patch (*Rhizoctonia solani*), pythium (*Pythium* spp.), and red thread (*Laetisaria fuciformis*) (Bonos et al., 2006; Smiley et al., 2005).

PROCEDURES

Two perennial ryegrass trials were established in 2016 (Tables 1,2), one perennial ryegrass trial was established in 2017 (Table 3), two perennial ryegrass trials were established in 2018 (Tables 4,5), and one perennial ryegrass trial was established in 2019 (Table 6). All trials were hand sown with 0.88 oz of seed into 3 ft × 5 ft plots (3.7 lb seed/1000 ft²) and arranged in a randomized complete block design with three replications. A 6-inch unseeded border was made to limit contamination. The annual rate of nitrogen and mowing height for each trial are represented in (Table 7). Single fertilizer applications did not exceed 1.0 lbs N/1000 ft². The trials were maintained to encourage biotic and abiotic stresses but were irrigated to avoid drought stress. Turf plots were mowed regularly to 1.5" height.

Dimension (dithiopyr) was used on all perennial ryegrass trials for preemergent control of annual grass and broadleaf weeds in April, June, August and October. Topeka (dicamba, dimethylamine salt), Weedar 64 (2,4-D), and Lontrel (clopyralid) were used to control broadleaf weeds. Merit (imidacloprid) was used to control grubs in June. Segway (cyazofamid) was used in August to control pythium disease, and Tenacity (mesotrione) was used to control grassy weeds in August.

¹Field Researcher IV, Laboratory Researcher II, Principal Laboratory Technician, Field Researcher IV, Graduate Assistant, Assistant Research Professor, Research Professor, and Research Professor, respectively, New Jersey Agricultural Experiment Station, School of Environmental and Biological Sciences, Rutgers, The State University of New Jersey, New Brunswick, NJ. 08901-8520.

Perennial ryegrass trials were evaluated monthly during the growing season for turf quality, *Bipolaris* leaf spot, gray leaf spot, dollar spot, color, and stemminess. All turf plots were rated by multiple evaluators to limit personal biases toward particular traits. Ratings were based on a 1 to 9 scale, with 9 representing the most desirable turf characteristics. Data was summarized and subjected to an analysis of variance (ANOVA), and means were separated using Fisher's protected least significant difference (LSD) mean separation test.

RESULTS AND DISCUSSION

Results for the perennial ryegrass trials established in 2016 through 2018 (Tables 1-5) were ranked by overall turf quality. High turf quality averages indicate good disease resistance, dark-green color, high shoot density and uniformity, fine leaf texture, low growth habit, good mowing quality, and minimal damage from insects. Trials were further ranked using additional parameters (i.e., establishment, color, disease rating, etc.) to distinguish cultivars or selections that were equally ranked based on turf quality ratings. The turfgrass trial established in 2019 (Table 6) were primarily ranked by gray leaf spot disease ratings and secondarily ranked by turf quality ratings.

Turf Quality

Perennial ryegrass is popular for overseeding home lawns, athletic fields, golf courses and other general turf areas. Since the release of the first turf-type cultivars in the 1960s, improvements have been made to overall turf quality (Huff, 1997). In the 2016 perennial ryegrass test (Table 1), PST-2MAY, PPG-PR-301, Xcellerator, PST-SYN-2DML, and PPG-PR-342 had the highest turf quality, while Double Time GLS, Playfast, MSP 4044, Royal Green, and Double Up GLS had the lowest turf quality. In the 2016 perennial ryegrass NTEP test (Table 2), Furlong, AllStar Fore, Slugger 3GL, DLFPS-236/3547, Alloy, NP-2, PPG-PR-421, PPG-PR-423, and SR 4700 had the highest turf quality, while LPB-SD-105, DLFPS-238/3014, Brightstar SLT, BAR LP 6162, and Linn had the lowest turf quality. In the 2017 perennial ryegrass test (Table 3), FCW, PR-6-16, PR-7-16, Silver Sport, PST-2FLCP, PST-2GLM, 2CL6, PPG-PR-437, and PR-8-16 had the highest turf quality, while Prelude IV, Double Time, Bizet 1, and Fabian had the lowest turf quality. In the 2018 perennial ryegrass test (Table 4), GR4 Comp, Principal II, Home-

run LS, GR3, and GR1 had the highest turf quality, while ORPRG16-7, ORPRG16-5, Laredo II, Tetra Grain, and ORPRG16-6 had the lowest turf quality. In the 2018 perennial ryegrass CTBT test (Table 5), DLFPS-236-3547, DLFPS-236-3582, PPG-PR-438, PST-214, PPG-PR-478, PPG-PR-436 had the highest turf quality, while APR2839, SEPR-3, SEPR-1, APR2846, and Brightstar SLT had the lowest turf quality. In the 2019 perennial ryegrass test (Table 6), 2CL3, PST-214, 2CL1, PPG-PR-489, and Paragon 2 GLR had the highest turf quality, while PRG-19MH, Cutter II, Panther GLS, Replay, Gator 3, PHX-NZ, and PRG-19DH had the lowest turf quality.

Gray Leaf Spot

Gray leaf spot (*Pyricularia oryzae*) is a prominent disease in the Northeast. Typical in late summer and early fall with warm temperatures and high humidity, the first symptoms appear as small, water-soaked lesions from gray to light brown with a dark border. Eventually, these lesions will mature and combine blighting the leaf blades forming a 'fish-hook' with gray spores. Conidia favorably produce under warm, humid conditions and are spread by wind and water but can be carried on lawn equipment as well. In the 2019 perennial ryegrass test (Table 6), 2CL3, 2CL4, 2CL1, PPG-PR-515, PST-2FOXY-16, and PPG-PR-524 performed well against gray leaf spot while Prelude IV, Panther GLS, Replay, PRG-19DH, and PHX-NZ were most susceptible to gray leaf spot.

Dollar Spot

Dollar spot is a widespread turfgrass disease that causes silver-dollar shaped spots of dead turf. On perennial ryegrass and other taller turfs, dollar spot infections may expand and coalesce, leading to larger areas of damaged turf. Dollar spot was evaluated in the 2017 perennial ryegrass test (Table 3), the 2018 perennial ryegrass test (Table 4), and the 2018 CTBT perennial ryegrass test (Table 5). In the 2017 perennial ryegrass test (Table 3), Virte, Tetrabark, Double Time GLS, Karma, FCW, PST-2FLAT, Wicked, Align II, and GO-143 performed well against dollar spot, while Sox Fan, EUS, PST-2PDA, Commander ST, Harrier, and Bizet 1 were most susceptible to dollar spot. In the 2018 perennial ryegrass test (Table 4), Double Time GLS, Peridot, Paradox GLR, PPG-PR-473, and Karma performed well against dollar spot, while ORPRG16-7, ORPRG16-6, PinStripe II, and Replicator were most susceptible to dollar spot. In the 2018 CTBT perennial ryegrass test (Table 5),

PPG-PR-436, PPG-PR-438, PST-214, PPG-PR-338, and APR2790 performed well against dollar spot, while NAI-LD52, SEPR-2, DLFPS-236-3024, and APR2839 were most susceptible to dollar spot.

Stemminess

Stemminess is an assessment for the amount of residual reproductive stems that remain in a turf plot after mowing. Stemminess was evaluated in the 2017 perennial ryegrass test (Table 3), the 2018 perennial ryegrass test (Table 4), and the 2018 CTBT perennial ryegrass test (Table 5). Ratings were taken on a 1 to 9 scale, where 9 represented a plot with little residual reproductive stems and 1 represented a plot with a lot of residual reproductive stems. The lack of stemminess is an attractive trait as it allows for a more consistent and visibly appealing turfgrass stand. In the 2017 perennial ryegrass test (Table 3), PR-15-16, 2CL6, PPG-PR-372, PPG-PR-437, PPG-PR-435, PR-28-16, Tetrady, Mercitwo, and Bizet 1 performed well for this trait, while PST-2EGS, Gallop, Gator 3, Double Time GLS, Panther GLS, and Prelude Iv performed poorly for this trait. In the 2018 perennial ryegrass test (Table 4), PPG-PR-437, Principal II, PPG-PR-436, PPG-PR-435, PPG-PR-438, Greenland, MN-EPR18 performed well for this trait, while Brightstar SLT, Charger II, LNSPRG1, Barbados, and Cutter II performed poorly for this trait. In the 2018 CTBT perennial ryegrass test (Table 5), DLFPS-236-3541, DLFPS-236-3547, DLFPS-236-3542, and Signet performed well for this trait, while Prosport 4, SEPR-2, and SEPR-3 performed poorly for this trait.

Genetic Color

In the United States, a dark green turf color is typically considered more desirable when compared to a light green turf. A focus of the Rutgers turfgrass breeding program has been to breed for darker green varieties of perennial ryegrass. Genetic color was evaluated in the 2016 NTEP perennial ryegrass test (Table 2). ASP0116EXT, Palace II, Paragon 2 GLR, RAD-PR 112, and MRSI-PR16 had the darkest color, while BAR LP 6233, LPB-SD-101, BAR LP 6165, and Linn had the lightest color.

SUMMARY

Turf type perennial ryegrass is very versatile with its high traffic tolerance, rapid establishment, improved disease resistance, and dark green color. These traits continue to make perennial ryegrass a dominant perennial grass in the turfgrass seed industry. Plant breeding has improved perennial ryegrass cultivars, but more research is needed to increase heat, drought, and salt tolerance, cold hardiness, resistance to crown rust, and its ability to survive under ice sheets for long periods.

ACKNOWLEDGEMENTS

This research was supported by the New Jersey Agricultural Experiment Station, State and Hatch Act funds, Rutgers Center for Turfgrass Science, other grants, and gifts. Additional support was received from the United States Golf Association and the New Jersey Turfgrass Association.
